# A breath of fresh air for the Röhnfried brand

**Alfred Berger**  
Biologist | Managing Director

This is not just a very special year for the Röhnfried brand, but also for me personally. In September we were able to mark the 70<sup>th</sup> anniversary of the Röhnfried brand with a festive ceremony and celebrate the 60<sup>th</sup> anniversary of Dr. Hesse Tierpharma – and I personally look back with gratitude on 15 years at the head of this company.

When I came to Hohenlockstedt about 15 years ago, Röhnfried had long been known to me as a breeder. Even as a competitor – though not a direct one, since it rather focused on the preparations and I was responsible for the Ovator compound feed at the Muskator factories in Düsseldorf – I already perceived the Röhnfried brand as a successful, globally active brand.

The use of Röhnfried products by the reference breeder was the main focus at that time. Many sport connoisseurs were and still are on the search for a holistic plan and not individual „fragments“. With our well-established Röhnfried brand, we have developed a comprehensive care plan for you and have since been giving you a precise explanation of why we recommend what, when and how. Today, our focus is also clearly on strengthening immunity, improving regenerative capacity and reducing the infection pressure – a goal that we have very successfully achieved with natural, functional feed supplements.

But if you know the racing pigeon scene, you also know that in Western Europe the number of breeders is strongly declining. For our company, which specialises in racing pigeons, this is quite an existential threat. A crucial turning point that demanded new ways and solutions.

## **New ways and a new logo**

In a first step, a few years ago we decided to concentrate entirely on our core competence – pigeon racing – and to expand our presence where pigeon racing is of great importance. First it was Eastern Europe, then Asia (especially China) where the world's largest marketplace has developed today, and finally the Arab world, in which we are very active at present. We thank the support of our great Röhnfried Racing Team that represents our brand globally.

In a second step, we brought changes that become evident in the transformation of our logo: alone for racing pigeons, the flying pigeon symbol in the logo has worked very well. With Röhnfried we also address other target groups, such as breeders of pedigree pigeons, hobby poultry keepers, rabbit keepers and others. Furthermore, we can see that ever greater demands are being placed on individual approaches. Reason enough to develop an „icon“ as a brand image that will work in all media and for all animal species. Röhnfried as a strong umbrella brand for a broader target group.

Stay with us!

**Yours sincerely,  
Alfred Berger**

# NEW DESIGN FROM 2020

From 2020, all our products will appear in a new design. Our logo has also received a discreet update. The conversion to the new design will take place from January 2020. For environmentally friendly reasons, we will continue consuming/selling existing goods in the old design until the stock is exhausted.

# Products 2020

Accelerating regeneration	8	Keeping the airways free	26

Single bird application

# Feeding concept breeding

The quality of young pigeons is a direct consequence of optimum nutrition. What's crucial for breeding is whether the performance potential can develop to the full. For this reason, it's not enough to invest in the best and healthy parents, you must also ensure that the breeding animals receive the best possible nutrition at all times. With the feeding concept outlined below you leave nothing to chance. The result of these efforts are perfectly developed young pigeons. The feeding concept is based on a reduced amount of the difficult-to-digest peas and instead includes more high-quality and easily digestible toasted soy beans and seeds such as hemp, which are rich in valuable linoleic and linolenic acids. The optimised feeding

concept also includes as vitamins, minerals, trace elements and amino acids for best breeding performance. Especially when preparing for breeding the focus should be in administration of vitamin E.

**Note:** Gradually convert to breeding food before breeding no later than 5 days prior to coupling. After egg laying and until shortly before hatching up to 50% winter food can be fed.

**Winter breeding:** Especially during the cold time of the year, the optimised feeding concepts will promote regular egg laying, high fertilisation and hatching rates as well as a healthy and quick development of the young.

„During the rearing of the young, I regularly administer **Oregano-Schaffett** together with **Immunbooster**. This ensures that old breeding pigeons stay in the best breeding condition even at very cold temperatures and that the young build up a good immune system“.

# Feeding concepts winter/rest

The winter is suitable to bring the birds into an optimal condition for breeding or travelling after moulting. Vaccinations are also carried out in winter. Only with a sufficient supply of all essential nutrients a sufficient vaccination effect (formation of immunoglobulins (antibodies)) can take place. This includes long-term, optimised feeding and a phased administration of supplementary feeds that support the immune system.

The feeding concept for the winter phase is also based on a diet rich in dietary fibre with a high proportion of satiating raw

fibres. The protein content is reduced in order to avoid metabolic stress. The dosed supply of vitamins and trace elements in winter corresponds to optimal preparation, especially before and after vaccinations. In addition, sensible drinking water hygiene should also be part of the treatment of each feeding concept in the rest and winter time.

**Note:** After moulting until mating, feeding should be as short as possible.

„The pigeons stay with the products of Röhnfried healthier. Since I give **Avidress Plus** and **UsneGano**, I have no more burden with trichomonads.“

# Feeding concept young pigeons/training phase

Young pigeons in the training phase (at the latest 6 weeks before the pre-flights): If the young pigeons should not intensively „pull“, the health (Trichomonaden, intestinal parasites, bacterial general infections etc.) must be controlled.

At the beginning of the training phase the youngsters should already be accustomed to the training basket. A lighter mixture is recommended as food to get the pigeons „to pull“. If an increased joy of flying has then taken place, this must be taken into account in the form of a supplement of fat-containing grains.

If the young don't „pull“ despite their best health, we recommend to add **Carni-Speed** to the drinking water over 7 days and additionally daily **Hexenbier**. Afterwards the pigeons should show a pronounced joy of flying.

As soon as the training phase begins, the infection pressure should be reduced and the immune system strengthened from the intestine. Once the pre-flights have been completed, the feeding concept of the old pigeons should be adopted.

„After the pre-flights and price flights, all our pigeons, including the youngsters, are fed **Hexenbier** together with **Immunbooster** and **Entrobac**. With this we want to achieve that after the flight the intestine is immediately strengthened again.“

# Röhnfried's 7-point plan for the racing season

This feeding concept was developed for breeders who wish to feed their pigeons with complete safety while taking advantage of specific preparations that promote performance and health.

**The following destinations should be pursued during the journey over the course of the week:**

## 1. Accelerating regeneration

**Carbohydrates** – Regenerate faster after strenuous flights thanks to **Mumm** and **Rotosal**: The combination of energy supplier and essential minerals supports the metabolism and replenishes reserves.

**Proteins** – Protein stimulates muscle protein synthesis. Even after training or a race. We use highly concentrated animal protein from **K+K Protein 3000** to restore and maintain tissues and muscles the day after the flight.

**Amino acids** – We use **Bt-Amin® forte** to replenish the amino acid stores immediately after the flight. It contains essential amino acids in high dosage and at the same time covers the B-vitamin requirement without unnecessarily burdening the metabolism.

## 2. Reduce infection pressure

**Prevention is better than cure** – We use **Avidress Plus** to disinfect drinking water: The pH value of the water is lowered and the infection pressure is reduced in combination with **UsneGano**.

## 3. Strengthening immunity

**Improve immune competence** – The 1,3-1,6  $\beta$ -glucans contained in the **Immunbooster** activate the immune system and strengthen the immune system of the pigeons.

**Probiotics** – Health from the intestine – Probiotic bacteria in **Entrobac** improve the intestinal flora and increase the resistance of the pigeons.

## 4. Stimulating the metabolism

**L-Carnitine and Iodine** – The trace element iodine regulates the metabolism in the thyroid gland. Together with the vital substances in **Hexenbier**, the boosters for immune defence, down mice and shape enhancement contain at the beginning of the week. On top, the potential of the muscles is fully exploited with the help of L-Carnitine (**Carni-Speed**): the pigeons tire much more slowly and the training behaviour is visibly improved.

## 5. Replenishing vitality reserves

**Vital substances** – In order to meet the increased demands on the metabolism, the pigeons need additional minerals and vitamins. We recommend a dose of **RO 200 ready** at the end of the week.

## 6. Keeping the airways free

**Probiotics** – small helpers, big effect. After express stays, it has proved successful to treat the mucous membranes with **Avisana**: The pigeons have bright white noses and clean throats.

**Forces of nature** – Especially before hot flights, but also before the start of the season, it makes sense to keep the respiratory tract clear from the inside with vegetable oils and herbal mixtures such as **Avimycin forte** and **Atemfrei**.

**Freed breathing** – Pigeons orient themselves in their home area according to their sense of smell. Therefore it is important to send them with free airways on the races. **Rozitol** cleanses the noses and promotes the elimination of stuck mucus.

## 7. Optimised mineral supply

**Minerals and trace elements** – In addition to the goals described above, a continuous and optimally coordinated supply of minerals should be a matter of course. The daily administration of **Reisemineral** together with **Grit mit Anis** and **Leckerstein®** guarantees an optimised supply of minerals and trace elements.

*Info:*

Our feeding concepts for a successful season can be found on pages 46 to 49.

# 1 Rotosal

■ Regeneration ■ Liver relief ■ Improving performance

250 ml Bottle Art.-No. 11417

**Rotosal** is a liquid feed supplement based on organic phosphor and oligosaccharides to quickly counter phosphor and energy deficits before and after long-distance races and general stress such as after treatments, moult and breeding. The Butafosfan it contains provides liver relief, which in turn leads to improved performance during the race. **Rotosal** is stable in the trough for more than 8 hours and is mainly used to accelerate regeneration.

## Feeding recommendation:

For feeding with drinking water or with grain feed. **Before and after stresses:** 5 ml for 20 pigeons. **After intense stress:** 10 ml for 20 pigeons. **Moult/breeding:** 2-3 times a week 5 ml for 20 pigeons. Fresh drinking water daily.

**Tip:** 5 ml **Rotosal** for 20 pigeons as the last meal before a flight (e.g. peeled sunflower seeds) with feed.

Race

Fast Effect

Accelerated  
Regeneration

## Information

**Butaphosphan has become an important component in racing pigeon supplies, as it improves their physical condition before the flight and accelerates their regeneration following the race.**

After races lasting over two hours, we recommend the additional feeding of organic phosphorus butaphosphan to accelerate the regeneration of metabolic by-products. Butaphosphan has been used in livestock farming for many years for liver relief and regeneration after physical exertion. Especially after medium to severe exhaustion, one should be able to see how quickly the pigeons overcome physical strain and regenerate themselves. ■

# Bt-Amin<sup>®</sup> forte

■ Amino acids ■ B vitamins ■ Electrolytes

**1000 ml Bottle** Art.-No. 11642

**Bt-Amin<sup>®</sup> forte** contains high doses of amino acids, electrolytes and B-vitamins in a defined composition. The essential amino acids are readily available and are thus during medication treatments and in the travel time an optimal relief. The numerous high-dose B vitamins are essential for blood formation and nerve tonic during the travel season.

## Feeding recommendation:

15 ml per litre of drinking water. **While medication cures** daily. In the first drinker on flight day. In the **moulting season** 3 times per week.

Race

Fast Effect

Moulting

Regeneration

## Information

**A full reservoir of amino acids supports the immune system and helps to prevent injuries to the locomotor system.**

The muscles show less signs of fatigue and a better muscular and structural integrity of the muscle tissue can be observed. Therefore, amino acids should already be supplied ahead of the intensive training and race. Especially short intensive strain (trainings before races and private training races) lead to over-acidification by lactate and with ammonia on extended periods of strain. ■

# 1 Protein

## Support regeneration

**Maintaining or restoring the health of tissues such as the muscles and tendons as well as the inner organs, the blood and liver is our second priority in the course of the week.**

Therefore, it is of utmost importance to feed readily digestible protein in substantial amounts on the day following a competitive flight. Aside from observations, there are also scientific data on the protein metabolism in pigeons. They were gathered by Professor Haas from the University in Kiel (Germany). On the day after a competitive flight, analyses of pigeon blood reveal a marker for the catabolism (decomposition) of muscle tissue. This marker is not present immediately after the competitive flight, i.e. muscle tissue (protein) is not catabolised during the competition. However, on the day after the competitive flight – when the quickly replenishable energy reserves (glycogen) are already filled up again – some kind of ‘metabolic review’ takes place in the organism of the pigeons. As part of the musculoskeletal system regeneration the body renews the structure of muscle fibres. To accomplish this, the body needs available amino acids (AAs) to serve as building blocks. The different essential amino acids must be available in properly balanced and sufficient amounts. Still, this complex requirement can be easily met. The best suited protein sources are animal protein or mixtures of plant and animal protein with those amino acids added, which limit the protein biosynthesis.

**i** Under no circumstances should you feed large amounts of protein on the day the pigeons fly. In such a case, the metabolism would first generate the required energy using the protein. Protein cannot be completely metabolised. This leads to the accumulation of considerable amounts of ammonia. Since ammonia is cytotoxic, this leads to a condition often referred to as ‘blue blood’. The body eliminates ammonia by turning it into urea and uric acid, which will be eliminated via the urinary tract. These processes require energy and are therefore an unnecessary burden on the meta-

bolism. Longer recovery periods will be the result. These counter-productive processes can be avoided by implementing the recommendations for the energy recovery phase and the protein recovery phase in the above time sequence.

**i** Feeding electrolytes and shortchain amino acids is yet another way to speed up the recovery. Electrolytes are essential for the acid-base balance and they furnish needed salt. Since pigeons like other birds do not have sweat glands, electrolytes are not depleted in flight. Therefore, electrolytes are more important in the preparation for the next competition starting about mid-week until the end of the week.

The scientific literature confirms the importance of amino acid (AA) supplements in the recovery process. In contrast to feeding protein-rich grains or ‘modern’ protein powders, the respective supplements merely provide specific AA and/or short-chain AA compounds, which are often given in the drinking water. In flight, the latter supplements do not stress the metabolism like the supplementation with protein. Instead, these AAs and short-chain AA compounds support the recovery after stress and lighten the load for the liver. ■

# K+K Protein 3000

■ Multi-protein ■ Muscle development ■ Immune support

500 g Can Art.-No. 11613

**K+K Protein 3000** is an easily digestible protein concentrate made from animal and plant proteins with a crude protein content of 65%. In addition to muscle development **K+K Protein 3000** supports digestion with the siliceous and healing earth it contains. **K+K Protein 3000** also contains valuable immunoglobulins which support the immune system and thus strengthen the body's defences after the flight. The added limiting amino acid methionine ensures smooth protein metabolism and excellent plumage development during the moult.

## Feeding recommendation:

**Racing season:** 4 meals starting on the day of return, two measuring spoons (20 g) per 500 g feed. Can be fed together with **Entrobac** and **Avimycin forte**. **Breeding and moulting period:** 4 meals per week.

# K+K Gold Dragees

■ Individual feeding ■ Muscle building ■ Recovery/Regeneration

100 tablets Art.-No. 11636

**K+K Gold Dragees** contain easily digestible animal protein, obtained from high-quality fish and whey protein, as well as methionine, lecithin and magnesium for the rapid regeneration of travel pigeons. The tablet hardly burdens the metabolism and is therefore ideally suited as an individual supply for late returnees or heavily flown pigeons.

## Feeding Recommendation:

One coated **K+K Gold Dragees** (0.54 g) per pigeon after the race.

Digestion

Growth

Race

Long-term effect

Growth

Race

# 2 Aidress® Plus

- Prevent canker
- Healthy pigeons
- Inforce metabolism

1000 ml Bottle Art.-No. 11145 | 5 litres Art.-No. 11146

**Aidress® Plus** contains short-chain acids that lower the pH value of the drinking water to such an extent that the risk of infection is also lowered. It also contains minerals, trace elements, oregano and cinnamon. This mix together with the acids makes the metabolism more efficient. Pigeons looked after this way are simply healthier.

**Experiences:** Many vets who specialise in pigeons confirm that there is rarely any evidence of pathogenic organisms (trichomonads & bacteria) in the crop smear of pigeons fed with Aidress Plus.

### Feeding recommendation:

Administer daily throughout the year during racing season, breeding, moult and rest time: 10 ml (1 dosage) per 2 litre of drinking water. Administration of medicines at the same time should always be discussed with a vet first. The dose size in the bottle neck is 10 ml. **Aidress® Plus** can be mixed with **Carni-Speed**, **UsneGano** and **Entrobac** without a problem. Shake before use!

With active formula

Hygiene

Long-term effect

## Information

**The reduction of the pH to a value of 4.5 means, for example, that no trichomonads can proliferate in the drinking trough and that the treatment of these infestations with drugs can therefore be reduced to a minimum.**

Conventional preparations for the acidification of drinking water have a reliable and safe effect in the drinking trough and in the anterior digestive tract. Initially, it was not possible to affect the digestive tract sufficiently as they were neutralised by special buffer substances after the gastric passage. As of this year, there exists the possibility of extending the mode of action with the help of special fatty acids so that the effect reaches far into the small intestine. This mixture of short and medium-chain fatty acids has both a traditional pH-lowering effect and an innovative effect on the intestines against bacteria that are difficult to fight, such as streptococci, staphylococci and clostridia. ■

# Avitestin

■ Intestinal health ■ Drinking water quality ■ Metabolic efficiency

500 ml Bottle Art.-No. 11462

**Avitestin** is a mix of butyric acid and short and medium-chain fatty acids. It reduces the pH level of drinking water and thus reduces the risk of infection with gram-positive bacteria. The high-quality medium-chain fatty acids exert their effect far into the small intestine and promote intestinal health by promoting the growth of the body's own probiotics. The butyric acid it contains is active in the intestine, promotes the growth of villi and therefore improves immune defences. Furthermore, the acids ensure that the drinking water stays fresh for longer and they have a positive effect on the pigeons' metabolism.

## Feeding recommendation:

5 ml with litre drinking water.

Youngsters

Intestinal equilibrium

Hygiene

# UsneGano

■ Oregano ■ Usnea barbata ■ Strengthened combination

250 ml Bottle Art.-No. 11250 | 500 ml Bottle Art.-No. 11251

**UsneGano** consists of a beardlichen (Usnea barbata) tincture and oregano with the natural ingredients usnic acid, carvacrol and thymol. The importance of this unique combination of ingredients is known from the literature. Pigeons who are given **UsneGano** will have firm droppings and bright, white noses shortly after feeding.

## Feeding recommendation:

3 ml/litre drinking water.

100% natural

Intestinal equilibrium

Promotes digestion

# 3 Immune competence

## Boosting immunity

**More than ever, a high-capacity, activated immune system decides on victory or defeat, or better to say: on absolute top condition with constant top prizes or a normally resilient health.**

In recent years, science has made great progress in understanding how the active and the passive immune system get activated. That's why we use beta-glucans ( $\beta$ -glucans) for the activation of the immune system, which when regularly fed lead to an increased number of immune-competent cells. These cells play an important role in organizing the immune system. Furthermore, it was proved that feeding these  $\beta$ -glucans leads to a higher alert and thus to a significantly faster immune response of the body. This is especially important in situations of high risk of new infections, e.g., during a stay in the basket. It is recommendable to activate the immune system with the help of  $\beta$ -glucans before vaccinations and during the entire youngster period as significantly more antibodies are produced against pathogenic germs. Also, the feeding of these substances causes a significant increase of the phagocytosis, i.e. the removal of pathogenic germs from the cells. This is good reason to feed glucans also during and after the break-out of the infection.

### **Allicins and other vegetable functional substances**

For pigeons, a combination of  $\beta$ -glucans and a mixture of functional aromas proved its value. One of it is the often cited Alliin, the active component of garlic, which is made of the pre-stage Alliin by using the enzyme Allinase. Unfortunately, Alliin is not very stable. At room temperature, it decomposes for instance in liquids like drinking water only after a short time and becomes ineffective. For this reason, technological processing of garlic by freeze drying proved its value. Like this, the stable Alliin can be preserved. After the feeding, Alliin is processed into Alliin which in combination with cinnamon is very effective in combating E. Coli and Salmonellosis. At the same time, it

spares the positive intestinal flora, e.g. Lactobacilli. For a strong immune system, we also trust in feeding intestine active powdered cellulose. It extends the intestinal villi and thus enhances the entire intestine as well as the immune system.

### **The first combination of Alliin and functional supplements**

The **Immunbooster** is a new and unique combination of effective functional plant compounds in synergetic combination with germ reducing supplements. For the first time, these ingredients are combined in one single product. Substances with antimicrobial effects add to the important infection defense. Moreover, the immunity is boosted on several levels by important components which take care of detoxication and of binding toxins in the intestine. Additionally, and especially important after the illness, active iron supports hematosis for a faster regeneration of performance and navigation capacities. ■

# Immunbooster

■ Intestinal health ■ Binds mushroom poisons ■ With Alliin ⇒ Allicin

500 g Can Art.-No. 11551

**Immunbooster** stimulates the attention and reaction time of the immune system and thus the health of the pigeons from the inside. For the first time, we use functional trace elements such as copper and zinc in the **Immunbooster**, which are extremely suitable for the pigeons and round off the recipe of this innovation with a mycotoxin (fungus poison) binder. As in the **Jungtierpulver**, the **Immunbooster** contains prebiotic components, alliin, and colostrum to support the pigeons in stress phases.

## Feeding recommendation:

10 g per 20 pigeons per day over the food. **Before stress phases such as exhibitions or the training start:** 3-5 days; **Before the flight:** 3 days; **Breeding:** 2 times a week; **Moulting:** 2 times a week; **Young flights:** 4 times a week; **Young bird sickness:** daily; **Before vaccinations:** 7 days before vaccination. 1 heaped measuring spoon are 10 g. The food can usually be moistened with **Hexenbier** or **Moorgold**.

**Tip:** The pigeons should be introduced to the taste and smell before the season. Once the pigeons get accustomed to the smell, they eat **Immunbooster** quite gladly.

„From weaning until the beginning of the races, my young pigeons get **Immunbooster** and **Entrobac** together with **Hexenbier** three times a week on their feed. Once they've gotten used to the taste, they eat it without problems! When the journey of the young birds begins, they get **Hexenbier** together with **Immunbooster** and **Entrobac** on the first three days after the flight. As a result, their droppings are always in a very good condition. Through this mixture, I have significantly fewer problems concerning the young bird sickness.“

*Albert Derwa*

Promotes digestion

With active formula

Preventive protection

# 3 Healthy from the gut

## *Build up intestinal flora*

**Many scientific studies indicate that pre- and probiotics can have healthpromoting effects on the host organism. A distinction must be made between prebiotics and probiotics. The prebiotics are a food resource for probiotic bacteria in the intestine. They create a healthy intestinal environment and stabilise the intestine's natural flora, thus supporting the immune system.**

A successful probiotic has to meet the many different needs of modern pigeon racing. It also makes sense for it to be acid stable to be able to easily withstand the low pH value of the stomach so that it can exert its effect in the intestine without being destroyed by the stomach acids. The area of application of a probiotic leads to further requirements. Often they are prescribed to restore the gut flora following a course of antibiotics. Nowadays we have probiotics that contain high numbers of probiotic bacteria that can withstand frequently used antibiotics such as Colistin, Enrofloxacin and Amoxicillin. It is therefore possible to restore the damaged intestinal flora even while antibiotics are administered.

The probiotic bacteria promote the growth of lactobacilli in the small intestine by optimising the living conditions of the body's own probiotic bacteria. This crowds out pathogens such as E.Coli, salmonella and clostridia. An additional benefit of these new probiotics is that their metabolites inhibit the growth of fungi. It therefore makes sense that many preparations contain a special probiotic that feeds the friendly intestinal flora in the long term.

It is recommended that a probiotic is always administered after stressful periods. For example, a new feed or a lack of water over a long period can lead to dysbiosis (intestinal flora disorder) in the intestine and so weaken the pigeons' defences. The new generation probiotics reliably counteract this dysbiosis after stressful periods. To complete therapy after stressful periods such as training stress of young pigeons, stays in the enclosure and administration of medicine, it also contains vitamins in specific concentrations to accelerate regeneration as best as possible. ■

# Entrobac

- Stabilises the intestine
- Stable against antibiotics
- Inhibits fungal growth

600 g Can Art.-No. 11547

**Entrobac** is a feed supplement for pigeons. It contains probiotic bacteria and special prebiotics that are needed to populate the intestinal flora as best as possible. **Entrobac** is ideal for restoring the intestinal flora during or after strains, change in feed, stressful phases and treatments. The bacterial strain contained in it is stable against many antibiotics and therefore **Entrobac** is perfectly suited to restore the intestine during and after antibiotics treatment. **Entrobac** promotes a healthy gut flora, strengthens the immune system and represses harmful germs such as E. coli, salmonella and clostridia. The bacteria also produce metabolites that act against fungi.

## Feeding recommendation:

**In general:** 5g (1 measuring spoon) per 1 kg feed or per 1 litre drinking water; **Racing season:** For 2 days after the flight; **Moult & breeding:** 2 times a week; **Young pigeons:** 2 days before and 2 days after each show flight and prize flight; **After treatments:** 10g (2 measuring spoons) per 1 kg feed. To restore the gut flora after treatments, always feed for several days in a row. Can be fed together with **Avimycin forte** and **K+K Protein 3000**.

„We use **Entrobac** several times a week. We add it to the feed in the evening, straight after their arrival. It stabilises the intestinal flora, and the pigeons deposit great droppings already on the next day. A healthy intestinal flora is very important for both old and young pigeons.

We have had very good experiences consistently with **Entrobac**. When the veterinarian prescribes a cure, we use **Entrobac** at the same time. When used regularly, the young pigeons have no problems with E. coli. Another good property is the effectiveness against fungal infections. We have had no problems with them since we started using **Entrobac**.“

*Daniel Becker*

Intestinal equilibrium

Long-term effect

Promotes digestion

# 3 Forces of nature

## Moorgold

- Bowel cleanse
- Firm droppings
- User friendly

1000 ml Can Art.-No. 11461

**Moorgold** is a pure concentrate of healing mud. The humic acids contained in the intestine bind harmful substances and thus promote the natural discharge from the body. The new formula also contains special fibers, causing firm droppings after two to three feedings with **Moorgold** and the digestion is affected positively.

**Feeding recommendation:** 1 tablespoon per 1 kg feed.

## Kräuter-Gemüse-Mix

- Down feather moult
- Support of the airway health
- Healing herb mixture

500 g Can Art.-No. 11115

**Kräuter-Gemüse-Mix** consists of 17 different herbs. The mixture of a large variety of natural ingredients corrects nutritional deficiencies. Such deficiencies may occur, when pigeons cannot follow their instincts of feeding on herbs, humus, and soil in the fields. **Kräuter-Gemüse-Mix** – the herbs are beneficial for the intestinal tract and the airways. The mixture ensures that the droppings are solid, the moulting proceeds properly, the plumage is brilliant, and the airways are clean.

**Feeding recommendation:** 1 Measuring spoon = 10g per kg.

- Immune response
- Moulting of down feathers

500 ml Bottle Art.-No. 11310

**Hexenbier** is a vitality drink made of onions, honey, propolis, Echinacea (cone flower), elderberry juice, beardlichen (Usnea barbata), and garlic, which strengthens the resilience and causes exceptional eagerness to fly. After several days of giving **Hexenbier** the breast meat of the pigeons turns pink, the nose-wattle turns white, and the down feathers moult extensively.

**Feeding recommendation:** 20 ml per 1 litre drinking water.

## VitaloTop

- Promotes digestion
- Strengthens the immune system
- Contains chili extract

500 ml Bottle Art.-No. 11623

**VitaloTop** is an optimised mixture of plant extracts (3,5%) based on chilli and birch fig extract, specially formulated to compensate nutritional deficiency symptoms in pigeons. Extra deadnettle and rosemary extracts provide the benefits known through literature. Since pigeons cannot taste chili, we take advantage of its benefits in **VitaloTop**. These include promoting digestive enzymes and restoring the natural balance of the intestinal flora. **VitaloTop** is therefore ideally suited for immunodepressive stress phases, e.g. to support therapy during and after the disease phase of the young animal.

**Feeding recommendation:**

5 ml per 1 litre drinking water 2-3 times a week.

# 4 L-carnitine and Iodine

## *Stimulating the metabolism*

**An active metabolism is a precondition for top performance in modern pigeon racing. We recommend a traditional preparation that stimulates the metabolism. Additional functional ingredients can have performance improving effects! This is a central focus of our recommendations.**

Iodine has a strong stimulating effect on the metabolism, when used in large doses. A highly functioning metabolism helps pigeons to be in top shape. After only a few administrations of elementary iodine you can observe a clear change in the pigeons, which can only be achieved with elementary iodine. In addition to its role in thyroid function, iodine plays an important role in regulating physiological processes such as growth, moult and reproduction as well as immune functions; it also has anti-inflammatory and antioxidant effects. Iodine also plays quite an important role in the treatment of fungal diseases such as candida infections. Following antibiotic treatment several days of iodine administration is advisable. Iodine, because of its disinfectant effect, also plays quite an important role in treating and preventing pox diseases. L-carnitine is a functional component that has a key function in energy metabolism.

Studies show a clear effect from longterm feeding of pure carnitine. Studies show that longterm feeding of at least 50mg of L-carnitine per pigeon, will significantly improve their performance. It is absolutely essential to ensure continuous administration of L-carnitine during the racing period, because only then can L-carnitine be absorbed by the muscle cells. The performance improving effects can only be ensured with longer-term administration, which manifests itself in increased willingness to train.

The main importance of L-carnitine lies in the transport of fatty acids from the cytoplasm to the mitochondria, i.e. to the power stations of the cells,

which makes it important for the race because of energy production from fatty acids. L-carnitine is able to prevent muscle cramping and fatigue by binding free acetyl radicals and therefore avoid their damaging effect on muscle cells. L-carnitine is also a buffer for the damaging lactic acid, which means that the muscle, when under extreme stress, will not become "acidic" as quickly.

Under "normal" living conditions (outside the racing season) the L-carnitine requirements can mostly be met by self-synthesis. A deficiency can occur if in the case of low administration (mixed grain feed contains an extremely low amount of L-carnitine) there is an increased requirement. We have to assume a significantly higher requirement if physical strain is increased through training and racing. We therefore recommend that you feed L-carnitine over a longer period of time, which should deliver a positive effect. Racing pigeons fatigue less quickly, which allows flying speed to be maintained at a high level over a longer period. The indirect cell protection function of L-carnitine protects the muscles. This prevents the muscles from becoming "acidic", which is harmful, allowing the pigeon to deliver high performance in the long term.

During normal training at home, constant administration of L-carnitine leads to a much higher willingness to fly because of the influences mentioned above. The longer and more intense training units easily achieved this way lead to a proven training effect that puts a strain on all metabolic functions. The pigeons regenerate quickly even after heavy strain and the right conditions for top performance are in place.

L-carnitine increases performance indirectly by improving cell metabolism and leads to a shortening of the rest periods. ■

# Blitzform®

For pigeons

- Formation of blood
- Improving form
- Improving performance

100 ml Bottle Art.-No. 10850 | 250 ml Bottle Art.-No. 10851

To improve performance and disinfect trough water. High-performance pigeons cannot just be given grain feed and water. The pigeons will be in top form with **Blitzform®**! The pigeons will return home 5 to 10 minutes earlier! Because they will be in top form with **Blitzform®**. **Blitzform®** will ensure that racing pigeons are in top form and therefore fly faster. The health of the racing pigeons is significantly improved as a result of the easily absorbable iodine and iron and their body's defences and their vitality also improves. **Blitzform®** gives the pigeons a clean throat, shiny eyes, snow-white noses, shiny plumage and a pink breast with small stains. The organic iron contained in it facilitates the production of red blood cells, which transport oxygen in the blood.

**Note:** This veterinary medicine is marketed in accordance with the Small Animal Exemption Scheme.

Race

High economical

Hygiene

# Carni-Speed®

- Muscle protection
- Greater willingness to fly
- Promotes endurance

500 ml Bottle Art.-No. 11140

The main ingredient of **Carni-Speed®** is L-carnitine. This substance, which is similar to a vitamin, plays a central role in the metabolism of pigeons. With a dosage of 10 ml/litre drinking water the pigeons receive the required amount of L-carnitine, which science has shown to improve their performance. The magnesium and selenium contained in it also serve as muscle protection. The pigeons are much more willing to train and their endurance is increased.

**Feeding recommendation:** Daily 0.5 ml/per pigeon.

Long-term effect

Race

Training

# 5 Vital nutrients

Aside from the already mentioned components of the 7-point plan, the supplementation with vital nutrients is essential for an optimal feeding regimen throughout the year. This includes vitamins, trace elements, and minerals. These micro-nutrients are essential to keep the pigeons healthy. However, they do not provide energy. This distinguishes micro-nutrients from the macro-nutrients fat, carbohydrates, and proteins. Micro-nutrients are involved in many metabolic processes. Therefore, the pigeon feed should be supplemented with micro-nutrients throughout the racing season, when raising young pigeons, and during resting periods.

Arguably, vitamins are the best-known group of vital nutrients. The vitamins are grouped in water-soluble and fat-soluble vitamins. Vitamins A, D, E, and K are fat-soluble vitamins. Vitamin E for example is used as "breeding vitamin". Meanwhile, vitamin E was proven to work well when preparing pigeons for mating. The well-known C and B vitamins are water-soluble. Vitamin B12 is important for the haematosiis as well as for the degradation of certain fatty acids. In the racing season, the demand for vitamins increases. The same applies to trace elements and minerals. For example, adding magnesium to the feed supports the muscle functions. It is important not to exceed certain amounts of vital nutrients in the feed to avoid putting a strain on the pigeons during the flight season.

In the tried and proven method, the micronutrients are given in the middle of the week during racing season. The micro-nutrients are ideally mixed with the feed because this ensures the quick update and provides an about equal amount to every pigeon. Neutral oils are the best vehicle for attaching the vital nutrients to the feed. A mixture of neutral oils such as various plant oils, lecithin and fish oil is best suited for this purpose. The unsaturated fatty acids from fish and plant oils are important substances in the synthesis of hormones and cell components. They also suppress inflammation. By contrast, saturated fatty acids are mainly used as energy source. Saturated sheep fat is now properly used in the upkeep of racing pigeons.

Two components are beneficial in the preparation of optimal mixing oils for pigeon feeds. Lecithin should be added because it is scarce in plant oils but has tremendous benefits for the metabolism. Rice germ oil is another essential ingredient because it supplies many significant ingredients such as vitamin E and gamma-oryzanol. Vitamin E increases the fertility and is well-known as radical scavenger, which protects the cell from oxidative damage. The also present gamma oryzanol has a positive effect on muscle building. We want to enter into the discussion on the optimal way to give pigeons vital nutrients that saturated as well as unsaturated fatty acid have a proven beneficial effect on the uptake of micro nutrients. These fatty acids may either be plant or animal derived. We suggest select mixing oils or energy-providing compounds such as sheep fat. ■

# RO 200 ready

■ Fitness powder ■ Improving form ■ Improving performance

600 g Can Art.-No. 11253

**RO 200 ready** is a mix of prebiotics, electrolytes, amino acids, energy sources, minerals, trace elements and multivitamins. It is perfectly tailored to the needs of pigeons and promotes fitness until the day of the flight. The prebiotics in the preparation stabilise the intestinal flora and thus improve intestinal health.

## Feeding recommendation:

20 g (1 heaped measuring spoon) with 750 g feed or 1 litre of drinking water. **Racing season:** last 2-4 meals before day of flight, after races for strength. **Moult, breeding and rearing:** 2-3 times per week.

Race

Intestinal equilibrium

Long-term effect

*„RO 200 ready is a fantastic product in my opinion. I mix it together with **Gervit-W**® over the feed. When administered directly after the flight, one notices that the pigeons are back in shape in no time. I add it also the day before the start to improve their physical condition.“*

*Serge van Elsacker*

Promotes digestion

Perfect breeding

Promotes growth

# OptiBreed

■ Livelier animals ■ Stimulates libido ■ Healthy growth

1000 g Can Art.-No. 11564

**OptiBreed** contains a complex of active ingredients that improves protein synthesis. This boosts the growth of the young animals. Other components stabilise the intestinal tract for a stronger immune system. Its high vitamin E content increases the pigeon's libido and prevents deficiencies.

### Feeding recommendation:

Add 40g (approx. 1 tablespoon) to 1 kg of feed; the next step is to mix the whole thing vigorously for about 30 seconds until all the grains are wet. It should be fed 3-5 times a week in the breeding and rearing of the young.

# For an optimal supply - from the beginning...

## ...and in the future.

*„This year we have used **OptiBreed** for the first time for the breeding pigeons and totaly enthusiastic about it. When the youngsters were fed with grains, we gave **OptiBreed** over the food. We really had exceptionally well developed youngsters, super fertilization rates and a fantastic year overall. A product that covers everything in breeding“.*

*Uwe Müller*

# 6 Probiotic bacteria – small helpers, big effect

## Keeping the airways free

For this reason, Röhnfried took its research in a different direction and now uses innovative probiotic bacteria, which is an absolutely harmless way of keeping the airways of pigeons healthy. If you examine the mucous membranes microbiologically in more detail, you can see that it has pathogenic as well as non-pathogenic organisms (so-called probiotics) on it.

Recent research shows that bacteria exchange information through cell-to-cell communication (quorum sensing). These are very complex processes at the end of which messenger substances form the relevant signals. For instance, bacteria signal to each other "optimal conditions" if there is plenty of space and nutrition, which then leads to the bacteria multiplying and dividing more. Free space and good nutrition thus signals "good conditions" and encourages them to multiply. Not a lot of space and little nutrition, on the other hand, tends to cause the microorganisms to assume an arrested state, a so-called sporoid form. This means that bacteria, as a result of high population

density (many beneficial bacteria in a small space) produce signals that cause all bacteria to form a spore. This finding was the starting point for our completely new hygiene approach: we do not disinfect, rather, the mucous membrane is continuously populated with probiotic bacteria. This process is called microbiological management. It means that benign bacteria clean, so to speak, the surfaces. They do this by causing (through signalling) the undesirable bacteria to stop multiplying, which as a result are crowded out by the probiotic bacteria. The new generation probiotic microorganisms make use of this entirely new hygiene approach by populating the mucous membranes and thus enter into competition with the pathogenic organisms for food and space. This process of the "microbiological cleaning" of the mucous membrane creates a healthy and stable microflora. The formation of this probiotic microflora on the pigeons' mucous membranes provides protection from infections before and after a race, especially while the pigeons are transported. ■

## Avisana Nose drops for pigeons

- White noses ■ Clean throats ■ Free airways

50 ml Bottle Art.-No. 11416

**Avisana** is an active cleaner for all mucous membranes as well as noses and eyes, wounds, injuries and endangered body parts. It forms a stable and healthy microflora by populating the affected areas with safe probiotic bacteria. It is pH-neutral, very economical to use, and contains no colourings or odorants. Avisana forms a probiotic liquid film on the surface with a long-term effect, which usually means that disinfection is not necessary.

**Application recommendation:**  
When basketing and separating 1 drop per nostril

High economical

Race

Preventive Protection

# Released breathing

Why is it important to keep the air ways free? For decades pigeon breeders have talked about how keeping the air ways of the birds free helps to achieve top prizes. We wholeheartedly share this conviction and not only because it is obvious that birds need clear air ways to inhale an optimum amount of oxygen. It has been common knowledge for some years now, that the pigeons' sense of orientation and their olfactory sense go hand in hand.

This is why for quite some time, Röhnfried has focused on boosting the pigeons' air ways from within. On the one hand, the mustard oil of nasturtium, and horseradish proved themselves to be very efficient agents – natural antibiotics effecting the air ways via the bronchial tubes – causing no damages at all to the intestinal flora of the pigeons (**Avimycin forte**). On the other hand, we make use of the liberating effects of pure herbal oils like thyme, liquorice and eucalyptus which stimulate the trachea (**Atemfrei**) and thus help to haul out dust particles.

Lately, we found a new way how to liberate the air ways – especially in case of crusting or heavy mucous obstruction

in the upper sinuses. By boosting mucous production, this new Röhnfried product clears the upper sinuses fast and efficiently from stuck crusting and dust deposits collected during autumn and winter time. Additionally, this new cleaning product has antibacterial effects on the mucous membranes and helps to fight pathogenic germs. Experience from recent years shows that these methods in combination with probiotic bacteria protect and keep the sinuses healthy (**Avisana**). This way, one can reduce antibiotic treatments of the air ways which always have undesirable damaging effects on the intestinal balance. Moreover, this new method allows to abandon antibiotics during an entire racing period.

You can apply the new cleaner directly into the nose of the pigeon or feed it with the drinking water. Shortly after the application of the product, there might occur a temporary restriction of the olfactory sense of orientation (olfactory sense). We therefore suggest to allow for a time-lag of at least 5 days before a race or training when applying the product directly into the nose. ■

## Rozitol Nose drops for pigeons

■ Clean throats ■ More top prizes ■ Clear the airways

50 ml Bottle Art.-No. 11513

As we have known for a long time, pigeons orientate themselves in their home region by sense of smell. It is therefore important that the pigeons will be sent with free airways to the races. **Rozitol** cleans the nose and promotes the segregation of fixed mucous. Old mucous and dust is being liquefied and then swallowed by the pigeons or remotely via cotton swab.

### Application recommendation:

1 to 2 drops per nostril or 30 drop per litre of water.

Fast effect

Long-term effect

High economical

# 6 Atemfrei

- Frees the airways
- Strengthens the immune response
- Pure, natural herbal oils

500 ml Bottle Art.-No. 11161

**Atemfrei** is an herbal elixir, which contains various herbal oils such as liquorice, thyme, anise, fennel, and peppermint. These oils stimulate the metabolism inside the respiratory tract and promote the immune response. This increases the vitality of pigeons. Top quality herbal oils with their aromatic flavour and added vitamin C and zinc support the physiological functions of the respiratory tract.

## Feeding recommendation:

**Atemfrei** may be added to the drinking water or the feed: 10 ml per 1 litre drinking water 15 ml per 1 kg feed Give to pigeons for 5 to 10 days as needed. The dosage may be doubled in cases of severe stress.

**In the racing season after competitive flights:** give for 2 days during the first two days of the week. Shake well before use!

## Forces of nature

### *Liquorice:*

Liquorice is the medicinal plant of 2012. It is a blood depurative and expectorant. The glycyrrhizin in liquorice roots suppresses the growth of bacteria, viruses, and fungi.

### *Thyme:*

The volatile oils in thyme are bactericidal, mucolytic, and they promote expectoration. Thyme is also an antioxidant.

### *Anise:*

Anise is the medicinal plant of 2014. It has a mucolytic effect, stimulates the intestinal glands, and it is used to control vermin.

### *Eucalyptus:*

Eucalyptus has an antibacterial effect; it is mucolytic and improves the circulation. Eucalyptus is mainly used to alleviate respiratory problems.

# There is a herb for every illness!

**The importance of this piece of wisdom continues to rise from year to year in modern pigeon sport. Because more and more bacteria are becoming resistant to classic antibiotics. Plant-based antibiotics are therefore increasingly the focus of our research.**

In addition to the anti-bacterial effect there is often also an anti-fungal and anti-viral effect. There are few or very few side-effects of plant-based antibiotics; resistance is not observed at all. Another advantage of natural antibiotics: they do not harm the beneficial bacteria that live in harmony with us, such as intestinal bacteria, which means that they indirectly strengthen our defences. They are therefore also well suited for prevention. And they also supply us with vitamins, minerals, trace elements and other essential nutrients. We find substances with a strong antibiotic effect in all cruciferous plants (e.g. horseradish) and many members of the lily family (e.g. garlic). The inhibiting effect is usually due to the sulphur compounds and essential oils contained in these plants. It is only thanks to our modern procedures that we are able to make full use of these natural substances.

Traditional monastic medicine has known about the healing effects of the ingredients (the mustard oils) of nasturtium and horseradish for centuries. They are used to treat infections of the upper airways and the urinary tract. Only through breeding and controlled cultivation are we able to reach a high concentration of mustard oil in the medicinal plant. Mustard oils inhibit the growth of pathogens.

The benzyl mustard oil in nasturtium has a broad antibacterial effect for gram-positive as well as gram-negative bacteria. Allyl mustard oil in horseradish has good efficacy in the gram-positive spectrum (streptococci, staphylococci), while the 2-phenyl mustard oil shows an extended efficacy spectrum of gram-negative (E. coli and salmonella) bacteria. Both plant substances together are therefore a particularly effective plant alternative to chemical antibiotics. In contrast to the classic antibiotics, these natural active substances can also kill viruses, yeasts and fungi – in exactly the place where the infection is. This is because the mustard oils enter the blood in the upper intestinal section. This means that the naturally occurring “good” intestinal bacteria are not affected. ■

## Avimycin forte

■ More top prices ■ Metabolic relief ■ White noses

400 g Can Art.-No. 11626

**Avimycin forte** is a supplementary feed to help relieve and relieve the metabolism (methionine & milk thistle powder) after periods of illness and stress as well as to support the respiratory tract after racing. In addition to horseradish and nasturtium, it also contains milk thistle, turmeric, chili powder and methionine.

**Feeding recommendation:** 10 g per 20 pigeons over the food.

Fast effect

Long-term effect

High economical

# 7 Minerals and Trace elements

**Minerals are inorganic substances. Usually, they cannot be replaced by other elements. The lack or scarcity of minerals negatively influences the health status and performance of pigeons. It is therefore important to ensure the continuous supplementation with all minerals and trace elements.**

No matter how many types of grain you feed, it will not contain sufficient calcium. Therefore, it is important to give pigeons a calcium supplement every day, not only during the breeding and moulting periods but also e. g. for competitive racing, in rest and winter phases. Given today's forms of pigeon upkeep with drastically limited free flights, the pigeons must rely on breeders to provide them with the crucial minerals. Calcium (Ca) and phosphorus (P) are the basic building blocks for the bone formation and metabolism. In addition, Ca plays an important role in the functions of muscle and heart, in blood clotting, and for the proper acid-base equilibrium. In breeding, calcium deficiency causes problems with the egg shell formation and distorted breast bones. The chemical elements magnesium, sodium, potassium, chlorine, and sulphur are involved in many metabolic processes. They activate enzymes, are needed

for the neuromuscular signal transport, are essential for the optimal functioning of the muscles, and they play a role in establishing the proper osmotic pressure, electrolyte balance, and acid-base equilibrium. They are also required for the production of the stomach acid (HCl). A sufficient supply of minerals is therefore prerequisite to the ability to perform at a high level. As the name suggests, trace elements are present in the body in only very small quantities. By no means does this imply that they unimportant. Trace elements are e. g. important for the fatty acid and cholesterol synthesis and for the immune response. They also play a role in the energy metabolism.

The special mineral feed is given to the pigeons daily in small amounts before the main meal. These daily doses ensure that the pigeons are ready to take up the vital minerals. Our minerals are enriched with herbs and substances, which regulate the activity of the intestines. The mineral feed is coated with loam, which promotes the formation of digestive juices. This has a positive influence on the digestion. In the long run, the improved utilisation of the feed and the stabilisation of the intestines will lead to improved performances. This is the crucial benefit of optimised feeding. ■

## Leckerstein®

■ Excellent acceptance ■ Increased digestive activity ■ Supply of iodine and magnesium

12 pieces Art.-No. 11275

Pigeons like **Leckerstein®** because of the granulation and the way it is produced. It prevents mineral deficiency and iodine and magnesium have a positive effect on the condition of the pigeons. The good acceptance ensures that the pigeons also take up enough minerals and trace elements during the racing season.

Moulting

100% natural

Resting period

# Reisemineral

- In-flight performance
- Support of digestive system
- Stimulation of the metabolism

5 kg Bucket Art.-No. 11189

**Reisemineral** is a pure, natural product; it contains oregano and the Herba-San formula herbs. All essential minerals and trace elements as well as valuable effective agents and vital compound are included. Thanks to the excellent acceptance by the pigeons, the mineral demands are also met in the racing season. Vital components and valuable herbs stimulate the digestion and the metabolism. This boosts the flight performance.

**Feeding recommendation:** Daily small amounts.

Race

100% natural

Long-term effect

# Zucht- und Mausermineral

- Formation of feathers
- Osteogenesis
- Growth

5 kg Bucket Art.-No. 11190

**Zucht- und Mausermineral** is a pure, natural product containing oregano and herbs such as fenugreek, Aloe, sage, thyme, and cinchona bark. The amino acid methionine and all essential minerals and trace elements are also present to meet the special needs of breeding and moulting pigeons. The preparation promotes the correct shell formation and improves the bone formation in just hatched pigeons. The vital substances and valuable herbs stimulate the digestion and the metabolism.

**Feeding recommendation:** Daily small amounts.

Perfect breeding

Intestinal equilibrium

Moulting

# 7 Grit mit Anis

- Excellent acceptance
- Better digestion
- Stable acid-base equilibrium

5 kg Bucket Art.-No. 10697 | 25 kg Bag Art.-No. 10836

**Grit mit Anis** consists of a mixture of sea shells, quartz and redstone. These ingredients optimise the calcium level because calcium is available for a relatively long time. Quartz and redstones promote the digestion and the ingested minerals are part of the acid-base regulation in the pigeon organism. The excellent acceptance of **Grit mit Anis** is due to the added anise oil and the special structure of this mixture.

### Feeding recommendation:

Liberal supply as much **Grit mit Anis** as the pigeons ingest in a day.

# Standardmineral

- Balanced minerals
- Promotes the digestion
- Finely granulated quality

10 kg Bucket Art.-No. 11457

**Standardmineral** is a pure natural product; it contains all essential minerals, trace elements, and valuable vital agents and components. Feeding **Standardmineral** provides and balances needed minerals and stimulates the digestion and the metabolism. The fine granulation ensures the effective uptake by the pigeons.

### Feeding recommendation:

Feed ½ to 1 measuring cup of **Standardmineral** (70 to 140g) to 80 pigeons in the trough.

Moulting

Perfect breeding

# Topfit-Futterkalk

■ Vitamins ■ Minerals ■ Trace elements

1 kg Can Art.-No. 10955

**Topfit-Futterkalk** is a specially defined mix of vitamins, minerals and trace elements. If administered regularly, it promotes growth, muscle development, fertility and bone structure development. Especially for breeding and rearing **Topfit-Futterkalk** produces excellent results.

## Feed recommendation:

**Topfit-Futterkalk** can be given to racing pigeons in a feed container on its own to take freely or mixed in with food. **During moulting, breeding and racing period:** approx. 20 g **Topfit-Futterkalk** (1 tablespoon) for 10 pigeons.

# Mineraldrink

■ Weaning help ■ Supplier of minerals ■ Egg shell stability

500 ml Bottle Art.-No. 11582

**Mineraldrink** provides valuable minerals for breeding pigeons and youngsters in times of increased need, such as egg laying and during the rearing of the young pigeons. **Mineraldrink** is able to compensate mineral imbalances. The trace elements copper, manganese and zinc also ensure important metabolic processes in the organism of the pigeons.

**Feeding recommendation:** 5ml per litre of drinking water. **In preparation for breeding:** 2x per week. **While rearing the youngsters:** 3x per week. **For young pigeons until the racing season:** 2x per week. **After long-distance flights with longer basket stays:** the second day after the flight.

- Easy to use

60 tablets Art.-No. 11408

**Gamba-Tabs R** are for the treatment and prevention of Trichomoniasis and intestinal Coccidiosis. **Gamba-Tabs R** are also for the treatment and prevention of trichomoniasis which cause mucosal inflammation in the crop of pigeons.

*This veterinary medicine is marketed in accordance with the Small Animal Exemption Scheme.*

Medicine

Fast effect

Easy to use

# Badesalz

■ Insect repellent ■ Plumage care ■ Skin care

800 g Can Art.-No. 10531

**Badesalz** is recommend all year round but especially during moult. Dust, skin residue and dander, bad feathers and down are loosened, which promotes new feather growth and cares for the skin. This pigeons will have a shiny, silky plumage and it also acts against mites, bird lice and other parasites.

## Application:

1 measuring spoon of approx. 20g bath salt is added to 10 litres bathing water. Depending on the weather, the pigeons should be offered a bath 1-2 times a week.

Moultling

Hygiene

Long-term effect

# Aparasit®

■ Easy to use ■ Mites & ticks ■ Fleas & lice

750 ml Spray can Art.-No. 11485

**Aparasit®** is an anti-parasite spray solution for pest control. It quickly and reliably destroys mites, ticks, fleas, lice and other pests. Its easy-to-use spray nozzle makes it ideal for treating nesting cells and equipment.

## Instructions:

**Aparasit®** works against ticks, lice, mites and other pests. The pigeons' head, beak and especially the eyes must be protected. The young without full plumage, feed, eggs and drinking water must also not be sprayed. The majority of the parasites are in the pigeons' environment. Therefore especially the nesting cells, seating and the immediate environment should be sprayed thoroughly. Especially in the case of tick infestation, the treatment should be repeated after 3 days.

Long-term effect

Insecticides

Fast effect

# Bio-Air-Fresh

Spray solution containing essential oils for improvement of air

- Air quality improvement
- Dust binding
- Free airways

400 ml Spray can Art.-No. 11487

**Bio-Air-Fresh Spray** solution containing essential oils for improvement of air. It contains distillates of various herbs. These essential oils have been used to maintain the health of the respiratory organs for generations. Use of this product makes pigeons resistant to all kinds of colds.

## Application:

Spray 2-3 strokes into each loft, especially in the winter months. Also spray it at regular intervals during the breeding period and the 2 days a week in the racing season.

**Tip:** In the evening spray the pigeons' seating boards so that the pigeons inhale **Bio-Air-Fresh** all night long.

Easy handling

Long-term effect

High economical

# Vaccinations

Every pigeon fancier wants to have pigeons with excellent racing and breeding performance. There are many parameters influencing this, mostly depending on the breeders themselves. The quality of the pigeons (correct selection), the quality of the loft, the motivation, the training, or the management of the loft – all these parameters are important. But they are of no use if the pigeons are not healthy. Even the best pigeons cannot reach a top condition when suffering from parasites or an infection. Besides the right hygiene and nutrition, vaccinations are the most important instrument to prevent infectious diseases. A vaccination plan is essential to every loft. It is very important to provide special vaccination dates in the annual caretaking plan. It is also important to prepare the pigeons for the vaccinations. That means they should be in very good health and show no symptoms of illness. Therefore, the pigeons must be treated for parasites before they get the vaccination (ideally 2 to 3 weeks in advance). Additionally, their natural resistance should be boosted. Lots of stress, like heavy training or separation, should be avoided right before and after the vaccination.

## Paramyxo vaccination annual plan

In case, the pigeons cannot be checked by the veterinarian for coccidiosis, canker and worms, we suggest to follow this plan:

1. Old pigeons should get the vaccination during a rest period, i.e. between the moult and the breeding season, but no later than 3 weeks before the first training flight. When pairing the racing pigeons, too, you should follow this caretaking concept:
  - 6 weeks prior to the pairing – canker treatment for 5-7 days with **Gambakokzid RO** + simultaneously **Entrobac**
  - 4 weeks prior to the pairing  
**RO 200 ready + Immunbooster + Moorgold**
  - 3 weeks prior to the pairing paramyxo vaccination

Vaccination 3 weeks prior to the pairing ensures the high-degree transmission of the antibodies to the young pigeons. The parasite treatment prevents breeding disorders and avoids infections of the young pigeons. **Entrobac**, **Immunbooster** and **RO 200 ready** enhance the natural resistance and vitality of the pigeons.

2. Young pigeons should always get the vaccination twice during their first year. It is especially important to ensure best care and rest of the youngsters in preparation to the vaccination. If the parents were well prepared for the breeding and if the youngsters and their droppings look decent, usually there is no need for a parasite treatment. Any low degree infection by canker or coccidia stimulates the development of the immune system, and thus has a positive influence on the health of the pigeons. Besides this, it makes sense to keep the infection pressure low by feeding **Avidress Plus** and **Entrobac**, which prevents optionally/potentially pathogenic germs immediately after the separation.

In our regard, there are two vaccination concepts for young pigeons:

- ➞ First vaccination 5 days prior to the separation. However, the pigeons must be at least 3 weeks old. The second vaccination is applied 3-4 weeks after the separation.

or

- ➞ First vaccination one week after the separation, as soon as the pigeons got accustomed to their new environment. Apply second vaccination 3-4 weeks after that.
- ➞ In any case, one should avoid simultaneous vaccination, and separation of the youngsters. Being separated from the parents and moving into a new environment is a lot of stress to the young pigeons and reduces their resistance.

If the youngsters for any reason should fall ill after the separation, the vaccination should be delayed for 1-2 weeks. However, it is important that they get the second vaccination before the pigeons intensively train and race. 4-5 days before and after the vaccination we suggest to feed **Immunbooster + Entrobac + Moorgold** in order to stimulate the immune system. You should be aware of the fact that only the correctly vaccinated pigeons can develop a sufficient immunity and that a good preparation to the vaccination can save the pigeons from potentially negative effects. ■

# Coccidiosis

## Relevance

Besides canker, coccidia are the most frequent protozoan endoparasites of pigeons. Coccidia live in the small intestine and, just like canker, they cause a so called „factor disease“. This means, they are an indicator of the organisms' resistance. Coccidia often occur amongst young pigeons. They indicate low immunity, stress, collateral infections, worms or poor management of the loft. Today, the relevance of coccidiosis as a spontaneously occurring disease is rather low. However, it is an important reason for a potential loss of condition.

## Germ

Pigeon coccidia are protozoa of the type *Eimeria* spp., which reproduce in the epithelia cells of the small intestine. The pigeons live in balance with coccidia, i.e., as long as they are healthy, they show no symptoms. They get infected by ingesting the oocytes with the droppings of infected pigeons. It is important to know that only sporulated oocytes are invasive.

This means that only eggs which developed in the environment can cause a disease. The development time (sporulation time) is 24-48 hours. This is why a regular and thorough cleaning of the loft is very important in combating the spread of coccidia. In case of a low immunity, the course of the disease can become acute, causing diarrhea, problems with ingestion, dehydration, and excessive loss of weight.

## Symptoms

Early symptoms go from slightly soft droppings to slimy-watery to greenish, sometimes blood strained diarrhea.

- horrent feathering
- loss of condition
- loss of appetite
- loss of weight

## Diagnosis

Microscopic examination of fecal samples.

## Treatment

You can treat the pigeons with **Gambakokzid RO** or **Gamba-Tabs R**. At the same time you should administer **Bt-Amin<sup>®</sup> forte** or **Gervit-W<sup>®</sup>** over the drinking water. ■

# Worms

## Relevance

Nematode (hair worms and round worms) are types of worms often diagnosed amongst pigeons. Cestodes (tapeworms) which need an alternate host for their life cycle do not play a major role and are usually found only with single pigeons and never in a complete stock. Hair and round worms live in the small intestine of the animals. A low affection does not trigger symptoms, but it might cause a loss of condition and lower performance. Heavy affection disturbs the general well-being of the pigeon and might in rare cases cause a sudden death.

## Germ

Two of the most important nematodes with pigeons are: *Ascaridia columbae* (round worm) and *Capillaria obsingata* (hair worm). They have a direct life cycle (no alternate hosts). The infection of the pigeon happens by ingestion of infectious worm eggs. The eggs of both kinds are very resistant against many disinfectants, they tolerate frost and remain infectious for many months. In clinical terms, an infection with hair worms is more dramatic than an infection with round worms. One reason is that hair worms deeply penetrate the mucosa and feed from blood and tissue liquid. That's how they severely damage the mucosa of the small intestine.

It is also important to mention that in contrast to hair worms, round worms are host specific. This means that pigeons can be infected with hair worms through other birds like chicken, crows, sparrows.

The entire life cycle of round worms takes 4-6 weeks and that of hair worms 3-4 weeks (from ingesting the worm egg to secreting the worm egg with the droppings). In order to interrupt this cycle, a worming needs to be done twice, because not all preparations have a worm egg killing effect. Besides, one risks re-infection after the worming by ingestion of the eggs. Therefore, a good hygiene in the loft and disinfection are especially important during worm treatment.

## Symptoms

The symptoms depend on the degree of infection:

### General symptoms

- loss of condition and performance
- loss of appetite
- loss of weight
- diarrhea, with hair worms also bloody
- vomiting
- anemia
- paler eyes
- breeding disorders
- sudden death  
(caused by intestinal rupture or obstruction)

## Diagnosis

Affection by hair and round worms is diagnosed by microscopic examination of fecal samples.

## Treatment

You should treat the pigeon with **Wurm-T**. It is suggested to simultaneously feed **Gervit-W**<sup>®</sup>. A thorough disinfection is also unconditional in order to avoid re-infection with worm eggs. ■

# Salmonellosis (Paratyphus)

## Relevance

Salmonellosis is a major threat to every pigeon fancier. The disease triggers a whole range of damages in the stock. Besides this, it is not easy to detect the disease. Many transmitters (infected pigeons without symptoms) do not secrete the bacteria permanently, but intermittently in intervals of several days.

## Germ

*Salmonella enterica typhimurium* variant Copenhagen is a gram-negative mobile bacillus. This variation is evidenced in 95% of pigeons with paratyphus and is called the pigeon type. Such host specific germs usually cannot infect other species or humans. Infection is possible in 3 ways: oral ingestion (canker milk, infected food or water), inhaling of infected dust or transmission from the female to the egg (transovarial yolk infection or cloacal egg-shell infection by permeating it within few hours). Usually, for healthy, well supplied pigeons with a healthy intestinal flora, ingestion of salmonellae is not dangerous. But infection is possible if the immunity of the pigeon is low (stress). Also, an infection might occur as a concomitant disease or after a treatment with antibiotics without restoring the intestines afterwards (administration of probiotic bacteria). The origin of infection with salmonellae in the environment can only be other pigeons, for example wild or city pigeons and latently infected carrier pigeons (subclinical form), who irregularly secrete the germ with the droppings. Mostly, salmonellae get into the loft by newly bought pigeons, after exhibitions, or via racing pigeons which took the germ with them from the cabin express. In the loft, the germs can spread over months unnoticed.

## Clinical symptoms

The out-break of salmonellosis in the loft usually happens in the late breeding season. Reasons are stress and low immunity which is related to passing on immunoglobulin to the young-

sters. Young pigeons infected by their parents show symptoms while still in the nest, after separation and during the moult. Salmonellosis shows various disease patterns. It depends from the way of infection, the amount of ingested bacteria, and which organs got infected. Not always all infected pigeons in a loft show similar symptoms. Often, it is more a mixture of various symptoms.

## Diagnosis

The best moment for the diagnosis of salmonellosis is during the moult. The disease can break out in this period and especially the latently infected pigeons fall ill. The pigeons are weakened by the moult and thus, their immunity is more prone to infections. It also means that it is easier to detect the bacteria in a fecal sample then.

## Treatment

When detecting the described symptoms and suspecting salmonellosis, immediate treatment with antibiotics is unconditional. Ideally, the antibiotic is chosen according to a resistance test and pigeons are treated for 14-21 days.

Additionally, it is recommendable to feed Entrobac, Immun-booster and **Gervit-W**<sup>®</sup> in order to support the intestinal flora and the resistance. At the same time, the infection pressure must be reduced. That means, all germs in the environment must be eliminated. In order to do so, the loft and all tools inside should be disinfected with Desinfektion Pro (on the second and on the last day of the treatment). But first, the loft needs to be cleaned thoroughly. ■

# Condition improvement

## *Increase the condition of racing pigeons with Röhnfried products*

Preliminary information: We recommend Mifuma Power-Mix as the basic mix for this supply plan. Of course, the pigeons should be provided with fresh grit and delicious stone every day.

-  Strengthening immunity
-  Keeping the airways free
-  Replenishing vitality reserves
-  Reducing infection pressure
-  Accelerating regeneration
-  Stimulating the metabolism
-  Optimised mineral supply

### Racing day

On the day of the race, the focus is on rapid regeneration. Already with the first trough, Butafosfan stimulates the metabolism while the additional amino acids and carbohydrates initiate muscle regeneration immediately. The second trough uses oregano and organic acids to reduce the infection pressure and thus promote health.

### Sunday

On the day after the race, the provision of highly absorbable animal proteins ensures the necessary muscle growth while the immune system is strongly supported by pre- and probiotics. L-carnitine in the drinking water ensures good eagerness for flying right from the day after the flight. If necessary, a herbal treatment of the respiratory tract can also be performed.

### Monday

On the second day after the race, the immune system can be supported by probiotics while the simultaneous administration of humic acids stabilises the long-term intestinal health. When given with the drinking water, it also stimulates the metabolism and reduces the infection pressure. If necessary, even a herbal treatment of the respiratory tract can be performed.

### Tuesday

On the third day after the race, the immune system is further supported by means of probiotics and humic acids. If necessary, the herbal treatment of the respiratory tract can be resumed. L-carnitine additionally stimulates the metabolism via the drinking water.

## Basketing day

On the basketing day, we recommend feeding only Butafosfan with the drinking water. We also recommend treating airways with probiotic nasal drops when placing the bird into the basket

## Thursday

The pigeons are supplied with vitamins via the feed on both meals. In order to get the pigeons in top physical condition, we recommend adding Butafosfan to the drinking water in addition to L-Carnitine.

## Wednesday

From 400 km, the pigeons receive a meal containing highly absorbable vitamins and trace elements to improve their physical condition. The drinking water contains not only L-carnitine but also elemental iodine and a highly absorbable source of iron for top physical condition.

# Frequently asked questions...

*The most important questions at a glance – answered by Frederik Wolf, product manager*

***I have doubt that my pigeons drink too little of the water containing Avidress Plus***

If the pigeons do not want to drink the water with Avidress Plus, the dosage should be halved for one to two weeks to get them used to the taste. When the pigeons are used to the taste, they will also drink enough water in the travel season to deliver top performances.

***When is the best time to give electrolyte?***

Unlike humans, racing pigeons do not lose electrolytes during physical exertion, which is why the administration of pure electrolytes for regeneration after the race is not beneficial. However, on the day of the race it makes sense to administer them to replenish the electrolyte levels.

***Immunbooster is poorly eaten. What do you recommend?***

Immunbooster is a further development of the Jungtierpulver. It also contains activated carbon and active trace elements. The activated carbon gives the powder its black colour. The smell reminiscent of chewing gum has been specially developed for pigeons and, after a short period of getting used to it, promotes feed intake.

***How often should Hexenbier be fed?***

Hexenbier should be fed 7-10 days before the season as a cure. The pigeons react to it with increased joy of flying and a very good down moulting. If you have young pigeons that are relatively lethargic, you should use Hexenbier for 7 days in addition to a mixture rich in raw fibre. That way you can get the young ones up in the air quickly. In the travel season, we recommend administering it over a maximum of two days around the middle of the week.

*I could not see any increase in performance after giving Carni-Speed. How do you explain that?*

It takes a few days until the joy of flying increases. This improves behaviour during training, and better training brings better results in flights. Therefore, you should start giving Carni-Speed at least 14 days before the first training flights.

*Can I give Carni-Speed only twice a week at the beginning of the season, so that I can extra performance later?*

The effects achieved by Carni-Speed cannot be achieved in the short term. They can only be achieved if Carni-Speed is administered continuously. If it is fed only twice a week, you will achieve the opposite of what you intended. Fat burning is disturbed because not enough L-carnitine can be provided. So basically it is all or nothing. A minimum of one dose five days a week must be given to benefit from the positive properties of Carni-Speed.

*What can I do if old pigeons catch the young bird syndrome?*

Diseases are always triggered by an increased infection pressure and/or weakened immunity (resistance). This applies in particular to factor diseases, i.e. also to the facultative pathogenic germs, which we hold responsible for the 'young pigeon disease syndrome'. Facultative pathogens cannot cause disease with a healthy immunity. These only become disease factors in connection with immunodeficiency or a high infection pressure. In order to prevent these problems, two things must be clearly emphasised.

- 1. Reduce the infection pressure with Avidress and UsneGano**
- 2. Strengthen Immunity with Entrobac and Immunbooster**

1) Since the amount of pathogenic germs (infection pressure) has a decisive influence on each course of the disease, it is clearly the case that the infection pressure should be reduced during the racing phase, i.e. during the period of highest stress and greatest stress factors. This is a direct preventive measure. There is a whole range of possibilities, which are already very effective alone or combined.

2) High physical performance often leads to a weakened immune system. We all know this general correlation from top athletes who are much more susceptible to infection than other groups of people. Therefore, it should be our goal to help our racing pigeons develop a strong immune system before the racing season.

## More than a brand!

Dr. Hesse Tierpharma is a pioneer for care products and feed supplements. They enable you to provide optimal care and nutrition for your pets.

As one of the innovators in the segment of pigeon nutrition and other animals, we develop and produce care products and feed supplements for healthy and sporting animals.

More than ever, our central principles are oriented close to nature. We want to strengthen your animals through natural ingredients. The result of our intensive development is a range of unique, innovative and efficient nutritional supplements and care products. Being in contact with breeders from all over the world is very important to us, because your feedback enables us to improve our products.
